INPUT	FUNCTION	OUTPUT

INPUT
Given an array of integers,
return a new array with
each value doubled.

FUNCTION

OUTPUT
[1, 2, 3] --> [2, 4, 6]

1. declare function named maps with parameter x

2. return map method with x property[map targets each element
in the array with the provided function, and creates a new array]
(function name n fatarrow to declare function n times 2);
